

May 23rd - Weekly Update

Front-End Team [Prasanna and Kavya]

- Move from one image to next image, only that image corresponding polygons to be displayed in right panel.
- Edit of group id of annotated object to be added in setup.
- Delete of the individual annotated component.
- Save as json to be added to tool.
- Zoom and unzoom added.
- Point to mask and mask to point facility to be added to tool
- The slider to increase/decrease the points is also added. The points can't be decreased more than the original points.
- The custom made polygon name is added to the dropdown list automatically.
- Once someone restarts the tool, the tool will load the json if it is already annotated and display that output. Progress save feature implemented.

Back-End Team [Aravinthakshan and Janak]

- Complete Backend and Frontend Integration is completed, with the json dumping logic working with '/inference' route.
- The point to mask and mask to point code from before has also been integrated here into the workflow.
- manually tried out xmem+ritm workflow to see how addition and subtraction of object/points works with interactive correction propagation

Next Steps:

- Write a script to automate the ritm+xmem workflow
- Then, intergate this with the xmem integrated code
